

Instructions: Item Selection

Resource name		Item Selection	
Description		This resource allows you to create a puzzle whose solution requires participants to select a series of items from a given set on one or more occasions.	
Usage requirements		None.	
Settings			
Number of rounds		Each selection of items that participants must make to complete the puzzle is called a round. This setting allows you to select the number of rounds.	
Round	Text	This setting allows you to specify the text that will be displayed at the top of the screen during the round.	
	Image	This setting allows you to display an image at the top of the screen during the round. You can enter the URL of any image from your resource catalog.	
	Type	This setting allows you to select the answer type for the round. It can take the following values:	
		Single answer	If this value is selected, participants will only be able to select one element in the round.
		Multiple answer	If this value is selected, participants will be able to select several elements in the round with the order in which they are selected being irrelevant.
		Sorting answer	If this value is selected, participants will be able to select several elements in the round and the order in which they are selected will determine the answer.

	Items	In this section you must define all the items that participants will be able to select in the round. For each item you must specify at least one of the following two settings: <table><tr><td>Image</td><td>Graphic representation of the item. You can enter the URL of any image from your resource catalog.</td></tr><tr><td>Text</td><td>Name or title of the item.</td></tr></table> If you specify both an image and text for an item, it will be represented using both types of information.	Image	Graphic representation of the item. You can enter the URL of any image from your resource catalog.	Text	Name or title of the item.
Image	Graphic representation of the item. You can enter the URL of any image from your resource catalog.					
Text	Name or title of the item.					
Failure message	This setting allows you to specify the text that will be shown to participants each time they finish the last round and have not selected the appropriate items in all the rounds.					
Action after solving	This setting allows you to select the action that will be carried out after the puzzle is solved. It can take the following values: <table><tr><td>None</td><td></td></tr><tr><td>Show message</td><td>If this action is selected, a message will be shown to participants when they have correctly selected all the items in all the rounds. The message can be customized using the "Message" setting.</td></tr></table>		None		Show message	If this action is selected, a message will be shown to participants when they have correctly selected all the items in all the rounds. The message can be customized using the "Message" setting.
None						
Show message	If this action is selected, a message will be shown to participants when they have correctly selected all the items in all the rounds. The message can be customized using the "Message" setting.					
Background	This setting allows you to change the default background. You can enter the URL of any image from your resource catalog.					
Solution	You must link this resource to an escape room puzzle and specify a solution for that puzzle using the following format: $E_{1-R1}; E_{2-R1}; \dots; E_{n-R1} \& \dots \& E_{1-Rm}; E_{2-Rm}; \dots; E_{n-Rm}$ Let E_{i-Rj} be the number of the i-th element that participants must select in the j-th round to solve the puzzle. The items are numbered from left to right and from top to bottom. The first item, located in the upper-left corner, is number 1. The numbering continues to the right until the end of the first row and, if a second row exists, it continues from left to right on that row. For rounds with a single answer, only one value must be specified. For rounds with multiple answers, the values $E_{1-Rj}; E_{2-Rj}; \dots; E_{n-Rj}$ must be listed in ascending order, that is, from the lowest to the highest item number. For rounds with a sorting answer, the values must be specified according to the order in which the elements must be selected to solve the puzzle. For example, if solving the puzzle requires participants to select elements 1, 3, and 5 in any order in the first round, elements 3, 1, and 2 in that order in the second round, and only the first element in the third round, the following solution must be specified: $1;3;5\&3;1;2\&1$ In this case, the first round should be of the multiple answer type, the second of the sorting answer type, and the third of the single answer type (if only one element is to be selectable) or the multiple answer type. To solve the puzzle, participants must select the correct items in all the rounds. However, the number of rounds does not necessarily have to be greater than one. For example, if you want to present participants with a single set of items and require them to select, in any order, the second and third items to solve the puzzle, you must specify a single multiple answer round and the following solution: $2;3$
